Case Study: Konkan State Data Centre Operation & Maintenance

Synthetic case study of a fictional project for the TenderBridge demo.

1. Project facts

Project ID	PRJ-001
Client	Konkan State IT Society (fictional state agency)
Client type	State Government society
Contract value	₹24.60 crore (including taxes)
Period	1 April 2020 to 31 March 2025
Status	Completed
Nimbus role	Prime contractor (sole bidder)
Data centre racks	42
Technologies	VMware vSphere, Cisco Nexus, NetApp, Veeam, OpsCentral ITSM, Splunk
Completion evidence	KB-CC-001

2. Client context

Konkan State IT Society operates the State Data Centre that hosts 120 applications of 41 departments. In 2020 it selected a new operator after repeated SLA breaches by the previous agency, with a five-year O&M contract and a 90-day takeover.

3. Scope delivered by Nimbus

- 24x7 operation of a 42-rack Tier-III-designed data centre with 310 physical servers and 1,450 virtual machines
- Server, virtualisation, storage, backup and database (L1/L2) administration
- Management of core network, firewalls, WAF and load balancers inside the data centre
- EMS, NMS and ITSM tool supply and operation (OpsCentral suite) with an SLA dashboard for the client
- Quarterly DR drills with the state's DR site operated by another agency
- Security monitoring L1/L2 on the client's SIEM; patch and vulnerability management
- Helpdesk for departments and monthly SLA reporting audited by a third-party auditor

4. Implementation timeline

Period	Milestone
Apr-Jun 2020	Transition: inventory verification, 30 days shadowing, 15 days reverse shadowing
Jul 2020	Go-Live of O&M; ITSM tool live with auto-discovery CMDB
2021	VMware upgrade; backup modernisation to disk-to-disk-to-tape
2022-2024	Steady-state O&M; two hardware refresh cycles supported
Jan-Mar 2025	Exit management and handover to the successor operator

5. Team

Onsite team of 38 at peak (project manager, DC operations lead, 3 shift in-charges, 14 L2 engineers, 10 L1 operators, helpdesk), plus Pune remote NOC support.

6. Solution and operating model

Tower-based onsite team (compute and virtualisation, storage and backup, network and security, service desk) under one shift in-charge per shift. OpsCentral EMS/NMS fed alerts into OpsCentral

ITSM, which auto-created tickets and computed SLAs for the client dashboard. The Pune remote NOC provided L3 support, automation scripts and monthly reporting. DR drills were run with the separate DR operator using a joint runbook.

7. Outcomes

Monthly IT infrastructure availability between 99.93% and 99.98% over 60 months; 2 SLA penalty months (illustrative synthetic figures). These figures are invented for the demo and must be cited only as case-study statements, not as audited results.

Contract year	Average monthly availability (synthetic)	Months below 99.95%	Penalty months
2020-21	99.94%	3	1
2021-22	99.95%	2	1
2022-23	99.97%	0	0
2023-24	99.98%	0	0
2024-25	99.97%	1	0

8. Governance

Monthly service review with the client chaired by the client's nodal officer; quarterly steering committee; SLA reports from tool data audited by the client's third-party auditor where one was appointed. Escalation: shift in-charge, project manager, delivery head, Nimbus VP - Public Sector Business.

9. Client feedback (synthetic)

"The operator brought discipline to change management and made SLA reporting transparent." (fictional quote from the client's nodal officer)

10. Challenges and lessons learned

The incumbent's documentation was incomplete; the team rebuilt the CMDB from discovery data within 75 days. Two months with SLA penalties (2021) were due to storage firmware defects; root cause analysis led to an OEM-level fix.

11. Relevance notes for bid teams

Strong match for State Data Centre O&M tenders. Completion certificate KB-CC-001 states value, period and rack count.
